

When you create the [checkout process](#) in your on-line store, Kentico offers several possible options on how to display total prices or other total values of your shopping cart. All the possible options are available using the **Shopping cart totals** web part. You can place more **Shopping cart totals** web parts on a page to combine them and achieve your desired appearance.

To add the **Shopping cart totals** web part to your checkout process or to modify it:

1. [Place](#) the **Shopping cart totals** web part on your shopping cart page. If you want to modify an already existing **Shopping cart totals** web part, [open the configuration dialog](#).

- The **Web part properties** dialog appears.

2. Set the properties in the **General** category:

- **Total to display** – select which type of total the web part should display:

Products total	Total price of all <a href="#">products</a> in the shopping cart.  <a href="#">Discounts</a> that affect the prices of products are included, but <a href="#">order discounts</a> are NOT included.  The site's settings determine whether the value includes <a href="#">taxes</a> .
Shipping total	Total price of shipping. The site's settings determine whether the value includes <a href="#">taxes</a> .
Order discounts total	The total value (price reduction) of all <a href="#">order discounts</a> that apply to the shopping cart.
Total	The final total price of the shopping cart, after including everything (discounts, taxes, gift cards, etc.). This is the price the customer will pay.
Tax total	Total <a href="#">tax</a> of all items in the shopping cart and shipping.
Weight total	Total weight of the items in the shopping cart.
Other payments total	The total value that was subtracted from the shopping cart's total price due to redeemed <a href="#">gift cards</a> .

- **String format** – type the format used to display the totals.

- The {0} specifier represents the amount. For example, to display \$50, type \${0} into this field. To learn more about format strings, see [MSDN](#). If you leave the value empty, the system uses the default format string – you can set a default format string for each [currency](#) and for [mass](#).
- If the total is a monetary value (i.e., the total is expressed in a currency), the currency is specified by the [Currency selection web part](#) if available. If the web part is not on the page, the [main currency](#) is used.

- **Label** – specify the caption that the web part displays before the total value on the page.

3. Configure any other required web part properties.

4. Click **Save & Close**.

The system adds the **Shopping cart totals** web part or edits the existing web part, and displays the specified total on the given checkout page.
