

Before you can browse or manage the contents of a SharePoint site in Kentico, you need to specify a connection to the SharePoint server. The system allows you to define multiple SharePoint integration connections for the current Kentico site.

Managing SharePoint connections

To manage SharePoint integration connections, use the **SharePoint connections** application. The application allows you to manage all SharePoint connections defined for the currently selected site.

To manage existing SharePoint connections, use the following basic actions:

- **Edit** (✎) - opens the connection editing interface, where you can view and modify the connection details.
- **Delete** (🗑) - removes the connection.

SharePoint connection properties

Section	Properties
General	<ul style="list-style-type: none"> • Display name – the name of the SharePoint connection used in the system's administration interface, e.g. while configuring the SharePoint data source web part. • Code name – the string identifier of the SharePoint connection object used by developers in the code. Unless there is a reason to set a particular value, you can leave the default (<i>automatic</i>) option, and the system generates an appropriate code name. • Site URL – specifies the URL of the SharePoint site. • SharePoint version – the system supports Microsoft SharePoint 2010, 2013, 2016, and SharePoint Online.
Authentication	<ul style="list-style-type: none"> • Authentication mode • Username • Domain • Password

Adding SharePoint connections

To add a new connection to a SharePoint server:

1. Open the **SharePoint connections** application.
2. Click **New connection**.
3. Enter the SharePoint connection properties.
4. Click **Save**.
5. (Optional) In the **Connection test** section, click **Test connection** to verify that the connection is functional.

The system creates a new SharePoint connection. You can now use the connection when configuring the [SharePoint data source web part](#) or defining available [SharePoint libraries](#).

Testing SharePoint connections

You can verify if the system can connect to the SharePoint server specified in a connection.

1. Open the **SharePoint connections** application.
2. **Edit** (✎) a connection.
3. In the **Connection test** section, click **Test connection**.

The system informs you about the result of the connection test.
