

You can set the smart search to filter out results for pages that users are not allowed to access:

1. Open the **Pages** application.
2. Select the page containing the [web part](#) you use to get and display search results (**Smart search dialog with results** or **Smart search results**).
3. Switch to the **Design** tab and configure the web part (double-click).
4. Enable **Check permissions** in the **Page filter** category.
5. Click **OK**.

With the **Check permissions** property enabled, the search results display pages according to the [read permissions](#) of individual users.
