

When using [pages](#), you can set the [page type](#)'s **Page name source** attribute to determine the mapping of the page type database columns. However, [products](#) from the E-commerce Solution connect the *CMS_Document* table and the given [product page type](#)'s table also to the *COM_SKU* table. On this page, you can find which columns are mapped to which other columns.

The *SKUName*, *SKUShortDescription* and *SKUDescription* columns in the *COM_SKU* table are always mapped to another column:

- The *COM_SKU.SKUName* column is mapped based on setting of the **Page name source** attribute.
 - If you leave the (Use product name) option in the **Page name source** field, the value from the **Product name** field of the product page type is saved to the *COM_SKU.SKUName*, *CMS_Document.DocumentSKUName* and *CMS_Document.DocumentName* columns.
 - If you select a specific column in the **Page name source** field, the value from the **Product name** field is saved just to the *COM_SKU.SKUName* and *CMS_Document.DocumentSKUName* columns. The value from the selected column in the **Page name source** field is saved to the *CMS_Document.DocumentName* column and is displayed in the [product tree](#) and the page tree.

- The *COM_SKU.SKUShortDescription* column is mapped to the *CMS_Document.DocumentSKUShortDescription* column.
- The *COM_SKU.SKUDescription* column is mapped to the *CMS_Document.DocumentSKUDescription* column.

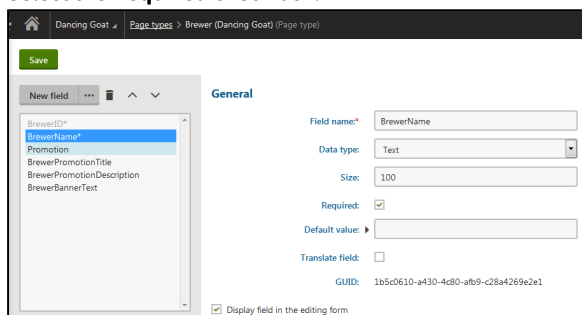

If you run a [multilingual store](#), the fields are mapped to each other only in the default culture of the site.

Using different names for SKUs and product pages

Due to the possibility of mapping some of the database columns, you can have different names for SKUs and for product pages.

1. [Create a new field](#) in the desired product page type. To be able to use different names:

- In the **Data type** drop-down list, select *Text*.
- Select the **Required** check box.

2. After saving of the new field, select the created field in the **Page name source** drop-down list.

The screenshot shows a configuration window with a 'Page name source field:' dropdown menu. The dropdown is open, and 'BrewerName' is selected. A red rectangle highlights the dropdown menu. To the right of the dropdown, there is a checkbox labeled 'Display' which is checked. Below the dropdown, there is a 'Page alias source field:' dropdown menu with '(Page name)' selected. At the bottom, there is a 'Quick links:' section.

3. **Save** the product page type.

If you now navigate to the **Products** application and edit a product of the modified product page type, you will see two name fields – the **Product name** field, which names the SKU, and the field you just created, which names the page.
