

In the **Email templates** application, you can find the following email templates related to the **Friends** application:

- **Friends - Friend approval** - template for an email or message confirming that a user approved your friendship request.
- **Friends - Friend rejection** - template for an email or message confirming that a user rejected your friendship request.
- **Friends - Friend request** - template for an email or message informing you that another user requested your friendship.

If you choose to **Edit** () a template, you will see two large text fields:

- **HTML version** - text of the template used for emails.
- **Plain text version** - text of the template used for the [Messages](#) application messages.

Links in these emails need to be handled by a special page containing the **Friendship management** web part. This is a special web part that ensures handling of these requests.

Macros in friendship email templates

In both fields, you can use the following [context macros](#) to include dynamic values in their text:

- **{% managementurl %}** - returns the friendship management page URL. See **Friend management path** in [Settings - Friends](#) for more details.
- **{% profileurl %}** - returns URL of the user who requested the friendship.
- **{% formattedsendername %}** - returns the name of the user who is requesting the friendship in the *username (fullname)* format.
- **{% formattedrecipientname %}** - returns the name of the user whose friendship is being requested in the *username (fullname)* format.

You can also access the following objects and their properties (e.g. `{% Sender.UserName %}`):

- **{% Sender %}** - *UserInfo* object of the user who is requesting the friendship.
- **{% Recipient %}** - *UserInfo* object of the user whose friendship is being requested.
- **{% Friendship %}** - *FriendInfo* object containing information about the current friendship.

You can also use any other macro expressions in the templates.
