

Kentico allows you to specify when a page is published. When you edit a page in the **Pages** application on its **Form** tab, you can typically find the **Publish from/Publish to** fields at the bottom of the form:

Publish from:	<input type="text" value="6/9/2013 8:25:24 AM"/>	 <a href="#">Now</a>
Publish to:	<input type="text" value="12/20/2014 8:25:25 AM"/>	 <a href="#">Now</a>

When you set the **Publish from/Publish to** values, the page will be displayed on the website only during the given time period.

- If you do not set the **Publish from** value, the page is displayed on the live site immediately.
- If you do not set the **Publish to** value, the page stays published until manually unpublished.

If the page is outside of the set **Publish from/Publish to** interval, i.e., the page is not yet published or the **Publish to** time is in the past, the page stays visible for you in the content tree of the **Pages** application and behaves as an [unpublished page](#). You can always change the **Publish from/Publish to** values to republish or unpublish the page.

### Scheduling pages that use workflow/versioning

If you set the **Publish from/Publish to** values to pages that use [workflow](#), they still need to be approved before being published. Once approved, the page is published by a scheduled system process. The process is set to execute every minute by default. The process only publishes the page if the page already reached its **Publish from** time. You can check the status of this process in the **Scheduled tasks** application. Choose the website and search for the **Content publishing** task.

#### Time zones

If *time zones* are enabled, the day and time values in the **Publish from/Publish to** fields are displayed in a format relative to the appropriate time zone. Otherwise the date and time values are relative to server time. See [Configuring time zones](#) for more information.
