

The system provides a way to export existing [portal engine page templates](#) as ASPX templates.

1. Edit your application's web.config file and add the **CMSShowTemplateASPXTab** key to the `<appSettings>` section:

```
<add key="CMSShowTemplateASPXTab" value="true" />
```

2. Log in to the Kentico administration interface
3. Open the **Page templates** application.
4. Select the required portal engine template in the tree.
5. Open the **ASPX code** tab.
6. Select the export type:

- **Template using master page**
- **Master page**
- **Standard page template**
- **Page template code only** (no code behind)

7. Choose a **Site** and fill in the **Template name**.
8. Click **Save to the disk**.

You can find the exported ASPX template in the web project's `~/CMSTemplates/<Site>/` folder.
