

Restoring a **LocalDB** database is similar to restoring a normal SQL database using the SQL Server Management Studio. However, you might encounter an error during the process:

"Property BackupDirectory is not available for Settings 'Microsoft.SqlServer.Management.Smo.Settings'. This property may not exist for this object or may not be retrievable due to insufficient access rights. (Microsoft.SqlServer.Smo)."

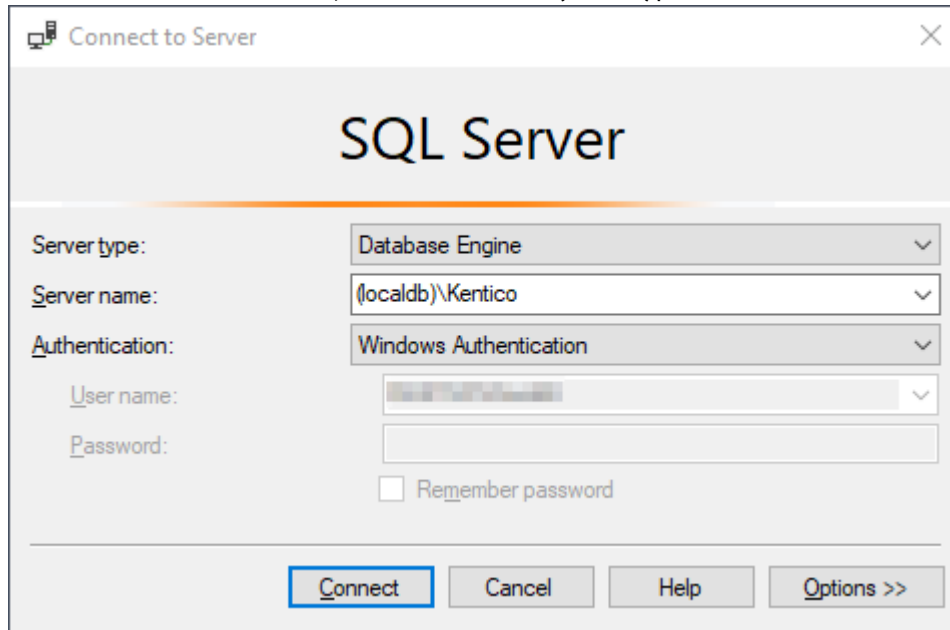

These steps provide a solution to this problem. We assume that you have created a backup of your database using the Hotfix and Upgrade Utility.

1. Open the **Registry editor** and navigate to HKEY_LOCAL_MACHINE\SOFTWARE\Microsoft\Microsoft SQL Server\MSSQL11E.LOCALDB\MSSQLServer.
2. Add these three String Values with the **path to your backed-up folder** as a value:
 - DefaultData
 - DefaultLog
 - BackupDirectory

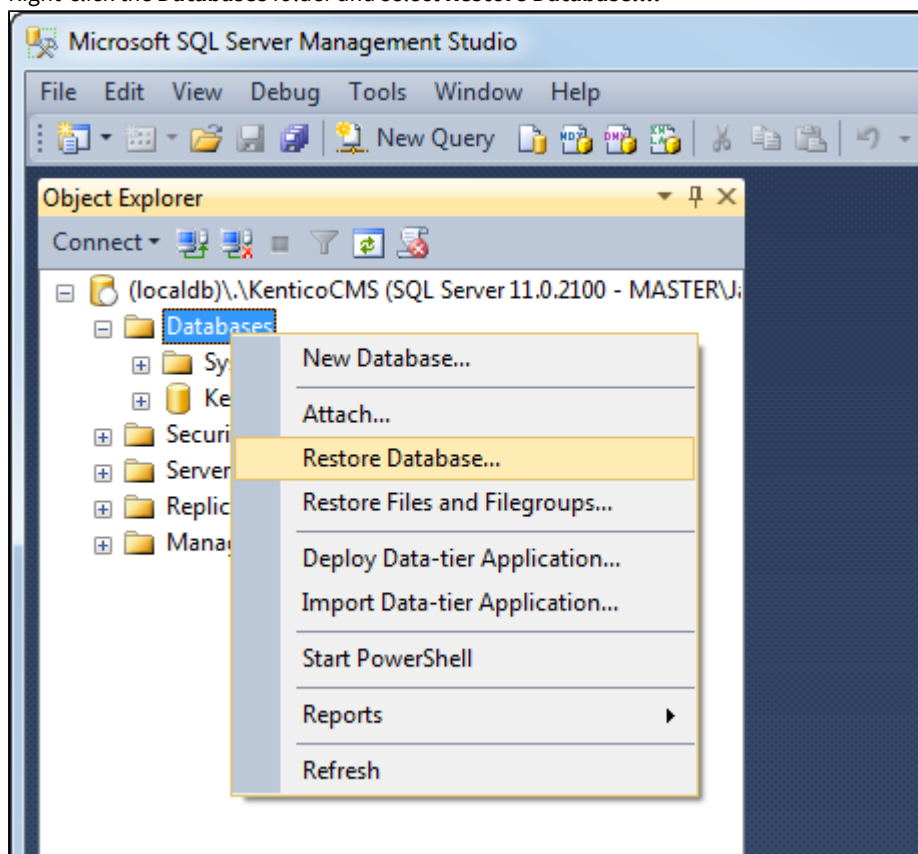

3. Open Microsoft SQL Server Management Studio

4. Connect to the LocalDB instance, use the server name: **(localdb)\Kentico**

5. **Delete** the old database.
6. Right-click the **Databases** folder and select **Restore Database....**

7. In the Source section, select **Device**.
8. Click the (...) button.
9. Click **Add**.

10. Select the database backup file (.bak) and click **OK**.

11. Click **OK** to begin the restore process.

The system now restores your LocalDB database.
