

On this page you can adjust settings related to the [Content staging](#) functionality.

Client (source only)	
Log content changes	Specifies whether content change tasks are generated. Check for source server.
Log data changes	If enabled, staging tasks are logged when data in custom tables are modified.
Log object changes	Specifies whether the object change tasks are generated, check for source server.
Log staging changes	If enabled, synchronization tasks are created for changes made by synchronization from another server to this server
Log export tasks	Specifies whether tasks are logged for the export feature when objects are deleted (incremental update support).
Staging service (target only)	
Enable staging service	Specifies whether the staging service is enabled. Check for target server.
Staging service authentication	Sets the authentication type used by the staging service. See Using X.509 authentication .
Staging service user name	Staging service user name for username authentication.
Staging service password	Staging service password for username authentication. Note: After you enter and save a password, the field always displays 8 "masking" characters, even if the password is longer or shorter. This measure helps protect your password.
X509 Certificates	
Client key ID	Staging service client certificate key ID.
Server key ID	Staging service server certificate key ID.
