

You can define new e-mail gateways for notification messages in the **Notifications** application. You can set the following properties when creating new gateways or editing existing gateways.

General	
Display name	Display name of the notification gateway.
Code name	Code name of the gateway.
Description	Text describing the gateway.
Enabled	<p>If unchecked, the notification gateway is not functional. This can be useful if you want to temporarily disable the gateway so that no messages will be sent, e.g. when you are performing some administration tasks.</p> <p>If checked, the gateway works normally.</p>
Gateway settings	
Assembly name	Name of the assembly in which the gateway code is stored.
Class name	Name of the class containing the gateway code; must be entered including the assembly name.
Supports message subject	Check if the gateway's message format supports message subjects.
Supports HTML text	Check if the gateway supports messages in HTML format (e.g. for e-mails).
Supports plain text	Check if the gateway supports plain text format (e.g. for SMS).
