

You can search for text in pages stored in the content tree.

To search in pages

1. In the **Pages** application, click **Search** .

2. In the **Website indexes** drop-down list, select whether you want to use a [locally stored smart search index](#) or the [SQL search](#):
 - a. **SQL search** – select (*SQL Search*). Slower, but supports search in both published and unpublished pages.
 - b. **Smart search** – select a particular smart search index. Fast, but does not support search in unpublished pages.

Note: [Azure Search](#) indexes are not supported by the page search.

3. Specify the rest of the search criteria:
 - a. **Search phrase** – the text that you are looking for. If using a search index, you can enter the syntax described in [smart search syntax](#). If using the SQL search, you can use standard SQL syntax.
 - b. **Search mode** – specifies how the search phrase will be used:
 - i. *Exact phrase* – returns pages where the search phrase is found exactly as entered.
 - ii. *Any word* – returns pages where at least one word of the search phrase is found.
 - iii. *All words* – returns pages where all words of the search phrase are found, regardless of their position or order in the text.
 - c. **Language** – available if your site uses multiple cultures.
4. (SQL Search) Use the **Only published** check-box to determine whether you want to include unpublished pages in the search.
5. Click **Search**.

The system lists the pages it finds below the search box.
