

To enable the Bad words functionality, go to **Settings -> Security & Membership -> Protection** and enable **Check bad words**.

On this page, you can also define the default action that will be assigned to newly created bad words. Bad words with the *Use default settings* option enabled (see [Defining bad words](#) for more details) will use this setting. You can select the default action in the **Bad word action** setting.

The default replacement string can be entered into the **Bad word replacement** field. The replacement text will be used when a bad word is detected and the following conditions are met:

- The **Replace** action is selected in **Bad word action** in **Settings -> Security & Membership -> Protection**.
- The particular bad word has **Use default settings** enabled for the **Replace with** field in **Bad words -> Edit (🔑) bad word -> General**.
