

Workflows can be defined separately for each language version of your pages by using culture-dependent workflow scopes. A workflow scope determines which pages are affected by a particular workflow.

To learn how to create workflows and workflow scopes, refer to the [Configuring workflows](#) chapter.

The system applies workflow scopes with the following priority (from highest to lowest):

1. Scopes with a specified page type and culture
2. Scopes with a specified page type
3. Scopes with a specified culture
4. Scopes without a specified page type and culture

The screenshot shows the Kentico workflow configuration interface. On the left is a sidebar with navigation links: General, Steps, Scope, E-mails, Pages, and Versions. The main area is divided into two tabs: 'General' and 'Advanced'. The 'General' tab is active and shows a 'This scope covers' field with the value '/News' and a 'Select' button. Below this are three radio button options: 'Specified page and its children', 'Only specified page', and 'Only child pages', with the third option selected. Under the 'Type' section, there are two radio button options: 'Apply workflow on pages in this scope' (selected) and 'Exclude workflow from pages in this scope'. The 'Advanced' tab is partially visible and shows 'Page type' set to 'News (CMS:News)', 'Culture' set to 'English - United States', and an empty 'Condition' field. At the top right of the main area is a green 'Save' button, and at the bottom right of the 'Advanced' tab are 'Edit' and 'Clear' buttons.
