

When editing forum indexes on the **Indexed content** tab in the **Smart search** application, select which [Forums](#) the search index covers.

**Note:** Forum indexes are only available as [locally stored indexes](#) (not as [Azure Search](#) indexes).

You need to define allowed or excluded forums.

←	<a href="#">Add allowed forums</a>	<a href="#">Add excluded forum</a>
General	≡	<b>Actions</b> <b>Forums</b> <b>Site name</b> <b>Index type</b>
Sites	 	(all) CorporateSite <b>Allowed</b>
Indexed content	 	WebsiteForums CorporateSite <b>Excluded</b>
Search preview		

## Adding allowed forums

1. Click **Add allowed forums**.
2. Use the **Site name** selector to choose the site whose forums you wish to index.
  - If you select **(all)**, all forums on all sites in the system will be indexed. Only websites assigned to the index on the **Sites** tab are available for selection.
3. If you selected a site in the previous step, click **Select** next to the **Forums** field.
4. Use the **Forum group** drop-down to select a forum group. The dialog lists the selected group's child forums.
5. To include a forum in the index, select the appropriate check boxes and click **Select**.

Alternatively, you can manually enter the code names of forums into the **Forums** field, separated by semicolons. All forums on the selected site can be added to the index this way, including group forums. The asterisk character (\*) can be used as a wildcard for any number of characters. For example, entering *\*community\** adds all forums that contain the string *community* in their code name to the index.

## Adding excluded forums

You can exclude individual forums if you have *all forums* allowed for an index.

To exclude a forum, click **Add excluded forums** on the **Indexed content** tab. The procedure is the same as when adding allowed forums.
