

On this tab, you can adjust settings related to the [Multi-factor authentication](#).

Note: The multi-factor authentication settings have a global effect. They cannot be configured differently for individual sites.

Multi-factor authentication

Enable multi-factor authentication	Indicates whether multi-factor authentication is allowed. Individual user accounts can be configured to require multi-factor authentication (for example during registration or manually by administrators).
Display secret key	<p>Indicates whether the system displays a secret key to users who sign in to Kentico for the first time (after multi-factor authentication is enabled). Users need to enter the secret key into their authenticator application to generate valid passcodes.</p> <p>Important: Only disable this setting if you have a custom implementation of multi-factor authentication.</p>
Multi-factor authentication is required globally	Indicates if all users in the system are required to use multi-factor authentication (including newly created users).
