

You can use built-in form controls to display badges in user profiles, or in any other form that displays or edits user data. By default, the User public profile web part uses the *CMS.User.DisplayProfile* form, which already includes the user's badge.

Changing badge appearance in User public profile

You can change how the badge appears in the default User public profile web part. You can use one of the two form controls that display badge data:

- **Viewer - Badge image (ViewBadgeImage)** - used for displaying the image of a badge.
 - **Viewer - Badge text (ViewBadgeText)** - used for displaying the Display name of a badge.
1. Open the **Modules** application and **Edit** () the **Membership** module.
 2. Switch to the **Classes** tab and edit the **User** class.
 3. Switch to the **Alternative forms** tab and edit the **Display profile** form.
 4. On the **Fields** tab, select the **UserBadgeID** field.
 5. Under **Field appearance**, change **Form control** to either **Viewer - Badge text** or **Viewer - Badge image**.

The User public profile displays either the badge image or badge display name.
