

In this section of the Kentico E-commerce Solution documentation, you can find examples and guidelines about customizing [product](#), [product options](#), [product page types](#), etc.

#### **Customizing product prices**

Implement customizations of the pricing functionality used for products. For example, adjust the system to load price values from a custom database column or integrate an external system that fully provides prices for products and their various configurations.

#### **Customizing product option forms**

Add new fields to product options that may have dependencies on other field's content.

#### **Mapping product type database columns**

Find out how product page types map their database columns to columns of the *CMS\_Document* and *COM\_SKU* database tables. Use different names for a product's SKU and for the product's page.
