

Kentico allows you to specify a watermark that will overlay the images used throughout the system.

You can have the system automatically apply watermarks to the following images:

- Page attachment images
- Media library images
- Object attachment (metafile) images

## To add watermarks to images

1. Navigate to **Settings -> System -> Files**.
2. Specify the watermark image that you want to use:
  - a. By a full relative path, for example, `~/CorporateSite/media/images/watermark.jpg`  
– OR –
  - b. By specifying the watermark image file name placed in `~/CMS/App_Themes/Default/Images/Watermarks`. For example, `watermark.jpg`.
3. Configure the other watermark [properties](#).
4. **Save**.

The watermark will now be applied to all the images for which it was configured.
