

You can find the settings related to WebDAV integration in **Settings -> Integration -> WebDAV**:

- **Enable WebDAV support** - this options enables/disables WebDAV in both Edit mode and Browse mode.
- **Supported file extensions** - list of file extensions that should be editable using WebDAV Edit mode. The **Edit in client application** (↗) icon is only displayed next to documents with this extension. Enter extensions with or without the leading dots, separated by semicolons; e.g. `.docx;.xlsx;.pptx;jpg;jpeg`. An appropriate client application with WebDAV support must be installed on the client machine for each listed extension in order for WebDAV editing of these files to be possible.

The screenshot displays the Kentico administration interface for WebDAV settings. On the left, a sidebar shows a tree view of settings categories: Settings, Content, URLs and SEO, Security & Membership, System, On-line marketing, E-commerce, Community, Social media, Social marketing, Intranet & Collaboration, Versioning & Synchronization, and Integration. The 'Integration' category is expanded, and 'WebDAV' is selected. The main content area is titled 'General' and contains two settings: 'Enable WebDAV support' with a checked checkbox and a help icon, and 'Supported file extensions' with a text input field containing the value '.doc;.docx;.ppt;.pptx;.xls;.xlsx;.rtf;.bmp;.gif;.jpg;.jpeg'. Above the settings are three buttons: 'Save' (green), 'Reset these settings to default' (grey), and 'Export these settings' (grey). At the top left, there is a 'Site:' dropdown menu currently set to '(global)'.
