

You can configure the system to cache files downloaded from a SharePoint server.

1. Open the **Settings** application.
2. Select the **Integration -> Microsoft SharePoint** category.
3. Enter values into the **Cache timeout (minutes)** and **File size limit (kB)** settings.
4. Click **Save**.

Within the specified time, the system caches all downloaded SharePoint files up to the specified size limit.

These settings can be overridden in the applied [transformation](#) using optional parameters of the **GetSharePointFileUrl** method. See [Displaying SharePoint data in Kentico](#) for more details.
