

Before you start using Kentico Controls in your project, it is recommended to add the controls to the **Toolbox** in Visual Studio:

1. Open your Kentico web project in Visual Studio. Use the **WebSite.sln** or **WebApp.sln** file in the website installation directory (`c:\inetpub\wwwroot\Kentico` by default).
2. Edit any ASPX web form file, for example **Default.aspx** under the project root. This is necessary, because the toolbox only offers the controls when working with ASPX markup.
3. Right-click the **Toolbox** and choose **Add Tab**.
4. Type the name of the new tab (for example **Kentico**) and press **Enter**.
5. Right-click the new tab and select **Choose Items**.
6. Click **Browse** on the **.NET Framework Components** tab of the **Choose Toolbox Items** dialog.
7. Navigate to the **CMS\bin** folder under your website.
8. Select the **CMS.DocumentEngine.Web.UI.dll** library.
9. Click **Open** and then **OK**.

The controls are now added to the Toolbox. You can drag the controls into the content of your web forms or user controls.

Apart from controls in the *CMS.DocumentEngine.Web.UI.dll* library, Kentico offers additional controls contained in libraries with the *.Web.UI* suffix. For example, the BizForm control can be found in the *CMS.OnlineForms.Web.UI.dll* assembly, the NewsletterSelector is located in the *CMS.Newsletters.Web.UI* assembly, etc.
