You can set the smart search to filter out results for pages that users are not allowed to access:

- 1. Open the **Pages** application.
- 2. Select the page containing the <u>web part</u> you use to get and display search results (**Smart search dialog with results** or **S** mart search results).
- 3. Switch to the **Design** tab and configure the web part (double-click).
- 4. Enable Check permissions in the Page filter category.
- 5. Click **OK**.

With the **Check permissions** property enabled, the search results display pages according to the <u>read permissions</u> of individual users.
