The On-line users module can be enabled in **Settings -> Security & Membership** by selecting the **Monitor on-line users** check-box.

If you are running the system on a web farm, also select the **Store on-line users in database** check-box. This causes information about on-line users to be saved in the database and also allows the system to provide more detailed information about guests (anonymous users).

The **Update on-line users (minutes)** property defines how often information about users accessing the site is reloaded. The value is entered in minutes. When running the system on a web farm, enter the same value which is set for the **Remove expired sessions** scheduled task (you can read the value in **Scheduled tasks ->** edit **Remove expired sessions** task **-> Task interval -> Every:** X **minute**).

The **Deny login interval** property determines how long users will not be able to log-in after they are kicked. The value is entered in minutes.
