The Form builder is designed to be used easily by users without technical background, like content editors or marketers. This topic provides instructions on how to adjust this environment.

Adding form controls to the Form builder

You may wish to add more form controls to the list of components offered in the Form builder. For example you can create customized inherited form controls, which would help the editors build the forms more quickly and easily.

To add form controls to the list of offered components, configure the controls in the following way:

1. Open the **Form controls** application.
2. Edit the form control that you want to add to the list of offered components.
3. Enable the **High priority** check-box on the **General** tab.
4. Select **Forms** in the **Show control in** section.
5. Click **Save**.

The form control will now be available for adding to forms using the Form builder.

Adding validation rules to the Form builder

You can adjust the validation rules offered on the **Validation** tab in the Form builder.

Navigate to **Macro rules -> Form validation**.

- Here, you can edit the existing rules or add new validation rules for validating fields in forms.
- These rules are also offered in the **Validation** section of the Field editor.
