The **Bundle** product representation is designed to allow your customers to purchase several different products as a single produ ct. This approach can be highly effective if you are offering related products, or products that don't sell well enough separately.

Defining a bundle

If you are adding a new product or editing an existing one (on the **General** tab), you need to select *Bundle* as the value of the product's **Representing** property. After doing so, the system displays the **Bundle** section, allowing you to enter properties specific for the Bundle representation.

Bundle	
Remove from inventory	Here you can define the behavior of the inventory. • **Remove bundle only** - the system removes the bundle from the inventory as a whole. • **Remove each product separately** - the system removes individual product items within the bundle from the respective inventories. • **Remove both bundle and products** - the system removes both the bundle and individual product items within the bundle from the respective inventories.
Products	Here you can add products to be shipped within the bundle: 1. Click **Add products**. 2. Select products in the displayed selection dialog as required. 3. Click **Select**. To remove selected products from the bundle, click **Remove selected**. To remove all products from the bundle at once, click **... -> Remove all**. ⚠ You cannot add the *Bundle* product representations into a bundle.

Bundle price calculation

During its price calculation, a bundle behaves as a separate product. Neither taxes nor discounts related to individual products contained in the bundle are reflected in the calculation.
