The **Database objects** application allows you to manage the database **Views** and **Stored procedures** used by the system.

If you have customized the underlying database tables used by views, you can refresh the views — either click the **Refresh** action for individual views or **Refresh all views**.

If necessary, you can edit views or stored procedures and customize the code.

> ❌ **Warning**: Modifying the code of the system's database objects is not recommended. Changes may lead to errors or incorrect behavior in the system.
