Kentico allows you to **access data stored on a SharePoint server** (Microsoft SharePoint 2010/2013/2016/Online), **and display it on your website**. You can achieve this by configuring a SharePoint integration connection, and placing the SharePoint web part, in combination with another web part displaying the content, into a selected page.

Besides, using the dedicated SharePoint application, you can **access and manage SharePoint data in the Kentico administration interface**.

- Configuring SharePoint integration settings further describes the system's configuration options for SharePoint integration.
- Example - Displaying a SharePoint picture library in Kentico provides a step-by-step description of how you can display a picture library stored on a SharePoint server on a Kentico website.

What you can do

- Get lists and list item data from SharePoint, and display it on Kentico pages.
- Add, modify, and delete SharePoint files using the Kentico administration interface.
- Download documents and images.
