Listing controls with custom queries allow you to display any type of data from the Kentico database, including:

- Pages
- Custom table records
- Other objects (classes)

The controls load data using pre-defined database queries assigned through their **QueryName** property. You can only select queries stored in the **CMS_Query** table of the Kentico database. You can create new queries or modify existing ones through the administration interface in:

- **Page types -> Edit page type -> Queries**
- **Custom tables -> Edit table -> Queries**
- **Modules -> Edit module -> Classes -> Edit class -> Queries**

You can format the data output using Kentico transformations.
